If any one of the ink tanks or ink cartridges is not installed, an error occurs and you cannot perform printing. When any one of the colours of ink has run out, you need to replace the ink tank or ink cartridge. For this reason, the number of sheets that can be printed with the first ink tanks is fewer than the succeeding ink tanks. When the printer performs cleaning, a small amount of ink is consumed. Depending on your model, we may ask you to replace it with a new one, or one with almost the same performance as a maintenance service. In this case, it may be that you cannot use supplies or accessories for your model or the compatible OS will be changed. Keep this in your mind when you use nongenuine ink. In addition, though it is a rare case and does not present a safety hazard, it is reported that a print head will become heated or smoke will be emitted from it due to an ingredient not contained in genuine Canon ink. Note that this does not apply to all nongenuine ink. If you disconnect the power cord, the date and time settings are reset and faxes stored in the printers memory will be deleted. Before you disconnect the power cord, confirm that faxes you need to keep have already been printed or sent.

well packed with all of the accessory pieces stored in separate bags. The printer was in a heavy duty plastic bag with handles, which made getting it out of the box a breeze. After plugging in the printer, the quick start guide got us started in a few simple steps. A small amount of ink will be used in the printer setup, but you will still have plenty left to make prints and become familiar with the machine. The orange cap will be removed before ink is installed. The rear area is open, allowing you to visually inspect the ink level. The forward area is packed with absorbent material and holds a portion of the ink volume above the outlet to the printer head. It does not really know how much ink is physically in the tank. Rather, it starts at 100%, then records nozzle firing data sent from the printer and subtracts volume. The system is very accurate, and you will indeed see a dry tank when it comes time to do a replacement. Installing the head, then inks into their carriage is simple and takes about a minute. It gives you a good idea of the amazing technology involved in inkjet printing and the truly small scale of a print head.

The same light blinks slowly when you're low on ink and quickly once the tank has been depleted. Errors will be identified by different sequences of blinking. Consult your online manual for help with decoding the sequence should you have a problem. Photo papers like luster, satin, and glossy at 10.4mil are expertly handled by the PRO100 with no misfeeds. If you're using matte paper or thick media, fewer sheets should be fed in at one time. Fine art stock, canvas, and specialty paper should be fed into the manual single sheet path. For some driver media settings, the printer will only allow the single sheet path to be used. The holder is placed into a front slot on the left side of the machine. Please note that you'll need specialty CD or DVD media coated for inkjet printing. That is to say when you're printing a typical photograph, the dots of ink that make up the photo are not visible at normal viewing distance or even fairly close inspection. This is especially true when printing on satin, luster, and glossy media. Solid blocks of color are uniform and smooth looking. Only in some midtone areas will you occasionally see a few dots. Again, one would need to be unnaturally close to the print to see them. Premium Matte using the Photo Paper Pro Luster and Matte Photo Paper media settings, respectively. The prints were allowed to dry eight hours, and then evaluated under balanced 4700k Solux lights. Saturation and color balance were similar. Even solid color patches and transitions were hard to distinguish upon casual viewing. The cast disappeared and grays shifted back to neutral at the higher settings. You can see the difference in these macro shots below. Keep in mind that these are macro image and the difference is not striking at viewing distance. Still, the smoother dot pattern and cleaner edges of quality level 2 and 1 will result in sharper looking prints. The Level 1 setting does not result in appreciably better print quality and takes 38% longer to complete.

Another first is detailed printer driver control of grayscale output. Photoshop was set to Printer Manages Color and no adjustments were made to the target file. We printed the target using the default, Cool Tone, and Warm Tone settings. After drying for eight hours the prints were evaluated under balanced Solux light. Intensity and contrast are sliders allowing for finer adjustments. The drop down menu below the pencil photo at right allows you to choose different preview samples. What actually happens on your printed image may be different. We suggest being judicious with changes and make small test prints when getting started. You will benefit from well prepared files, which means proper exposure as well as some additional midtone contrast. We're starting on the Quick Setup tab, which contains most of the controls you'll need for printing. Think of the media type as part color profile and part ink throttle. Different inkjet papers need different amounts of ink to perform properly and this is where the media setting becomes important. You have to set the media according to your profiles instructions in order to get the best results. Only manufacturer inkjet media are in this drop down. A slider controls the print quality setting. Level 2 corresponds to High and Level 3 to Standard quality. You will also find a third quality choice, the Level 1 setting. Canon has not given this setting a named label. Lower quality settings, such as Fast Level 4, are available when plain paper or envelope media are selected. You would choose this setting for text and light graphic printing. In Auto mode, the printer is completely in control of color management. You'll

choose this setting if you are not using a printer color profile, and if you have found the printers default setting to offer adequate output quality. We say rough because there is no color managed preview of your image with the changes.

The workflow pattern would normally be print, adjust, print, and adjust until you got the desired results. Profiles take the guesswork out of correction and faithfully reproduce your file to the best of your papers ability. Accessible from the printer properties Windows or the Print Studio Pro plugin, Pattern Print will setup and print a repeating series of your image on a single sheet of paper. Upon consulting the choices, you can dial in the recommended changes into the printers color adjustment controls. Make sure you let the test print dry at least an hour, preferably longer, before making any decisions. Under the heading Color Correction youll find Use this setting when you have a printer color profile and are using it to print via Photoshop, Photoshop Elements, Lightroom, Qimage, and the like. When Borderless is selected, you will notice the Amount of Extension slider appear. When printing without borders, the PRO100 will automatically stretch out the edges of a file to insure ink covers the edges of the paper. You can increase or decrease this function. Move the slider to the left for more extension. If you have a photo with important details at the edges reduce the amount of extension to avoid those areas being cut off. These are set by the factory and cannot be modified. The limits. You will notice 16.54 on the width scale. This seems to be a software coding error. You can call up your printer status dialog from this screen. Always turn it on when you use heavy or specialty media. We recommend using the feature with papers over 12mil thickness. Because dye inks dry rapidly the setting will likely not need to be changed. You can organize a vast number of images easily, or create collages, cards and other items from your favorite photos and print them. Moreover, you can perform various scans with one click. You can also adjust the margins or add text.

In addition, with simultaneously installed Image Display, you can enjoy patterns of collages and other items created automatically by the item recommendation function of My Image Garden as well as slide shows of images saved on a computer. You can See the Most Popular Compatible Papers for the PRO100 and Order a Sample Kit to Test. In most cases we used Printer Color profiles for the PRO100. Using profiles is always a good idea, and in the case of this new printer they really help increase the saturation and color accuracy. The satin surface minimizes fingerprints and better withstands handling. Red Rivers everpopular UltraPro Satin and true professional grade Arctic Polar Luster are sure to please when paired with the PRO100. Images virtually jump off the page and colors are vibrant and almost luminous. They are perfect for images and work where fine detail is important. A flat surface means more light gets directly back to your eyes. This means you see more detail and are not distracted by glare. Prints on 60lb. Premium Matte PLUS on the PRO100 show good detail, well balanced color and good saturation. You will greatly benefit from use of printer color profiles when printing on matte surfaces. Prints on Red River San Gabriel Baryta SemiGloss 2.0 and Blanco Matte Canvas looked great and help highlight the versatility of the PRO100. The printers speed and color quality are on par if not slightly better than the older machine. The addition of a specialty media path for thick papers is evidence that Canon acknowledges the advanced printing requirements of their photo enthusiast customers. Dots become visible only on magnified inspection of a print. Like most Canon printers, the PRO100 will feed card stock consistently through the standard paper tray. Being able to put a stack of Pecos River Gloss Note Cards into the tray, set the job and walk away is huge for card printers.

Add in the speed, photo quality, and robust build and you have a professional quality desktop card printing system. First, we missed 11x14 as an available borderless size. Read our 11x14 borderless hack for the PRO100. Red River Paper, and other suppliers, offer a wide assortment of paper in this popular photo size. Users of the PRO100 would undoubtedly benefit from that option. Paper sizes like Red River Papers 13x38 serve landscape and pano photographers who turn their images into 12x36 prints 13 aspect ratio. We feel that everyone can benefit from these sorts of upgrades.

Owners get more freedom to print what they want, paper makers can market more of their products to users, and Canon reaps the benefit of more ink sales. Win win all around. We're happy to share our knowledge from 15 years in inkjet printing with you! I am still learning which paper I like so the sample packs are a true blessing! These papers are acid free, lignin free and can be made of virgin tree fiber alpha cellulose or 25100% cotton rag. They are likely to have optical or fluorescent brightening agents OBAs chemicals that make the paper appear brighter white. Presence of OBAs does not indicate your image will fade faster. It does predict a slow change in the white point of your paper, especially if it is displayed without UV filter glass or acrylic. They are made from 100% cotton rag content and have no optical brightener content. OBA The base stock is acid and lignin free. The coating is acid free. This type of offers the most archival option in terms of media stability over time. Most photo grade media are resin coated, which means they have a paper core covered by a thin layer of polyethylene plastic. Plastic gives the paper its photo feel, stability flatness, water resistance, handling resistance, and excellent feed consistency.

With pigment inks in a protected environment, you can see up to 80 years on display life. All RC papers are Photo Grade for two reasons. Plastic content is not technically archival by museum standards. Also, the inkjet coating of all RC papers is slightly acidic. It facilitates instant drying and does not actually change the stability of your inks over time. Virtually all RC papers have optical brightening agents OBAs.
